

Nested Routes

(Project / TimeEntry Index)

Imagine you want to
display the time entries of
a project

Ironhack - Rails introduction

How do you identify it in
an URL?

Model: TimeEntry

/projects/<id>

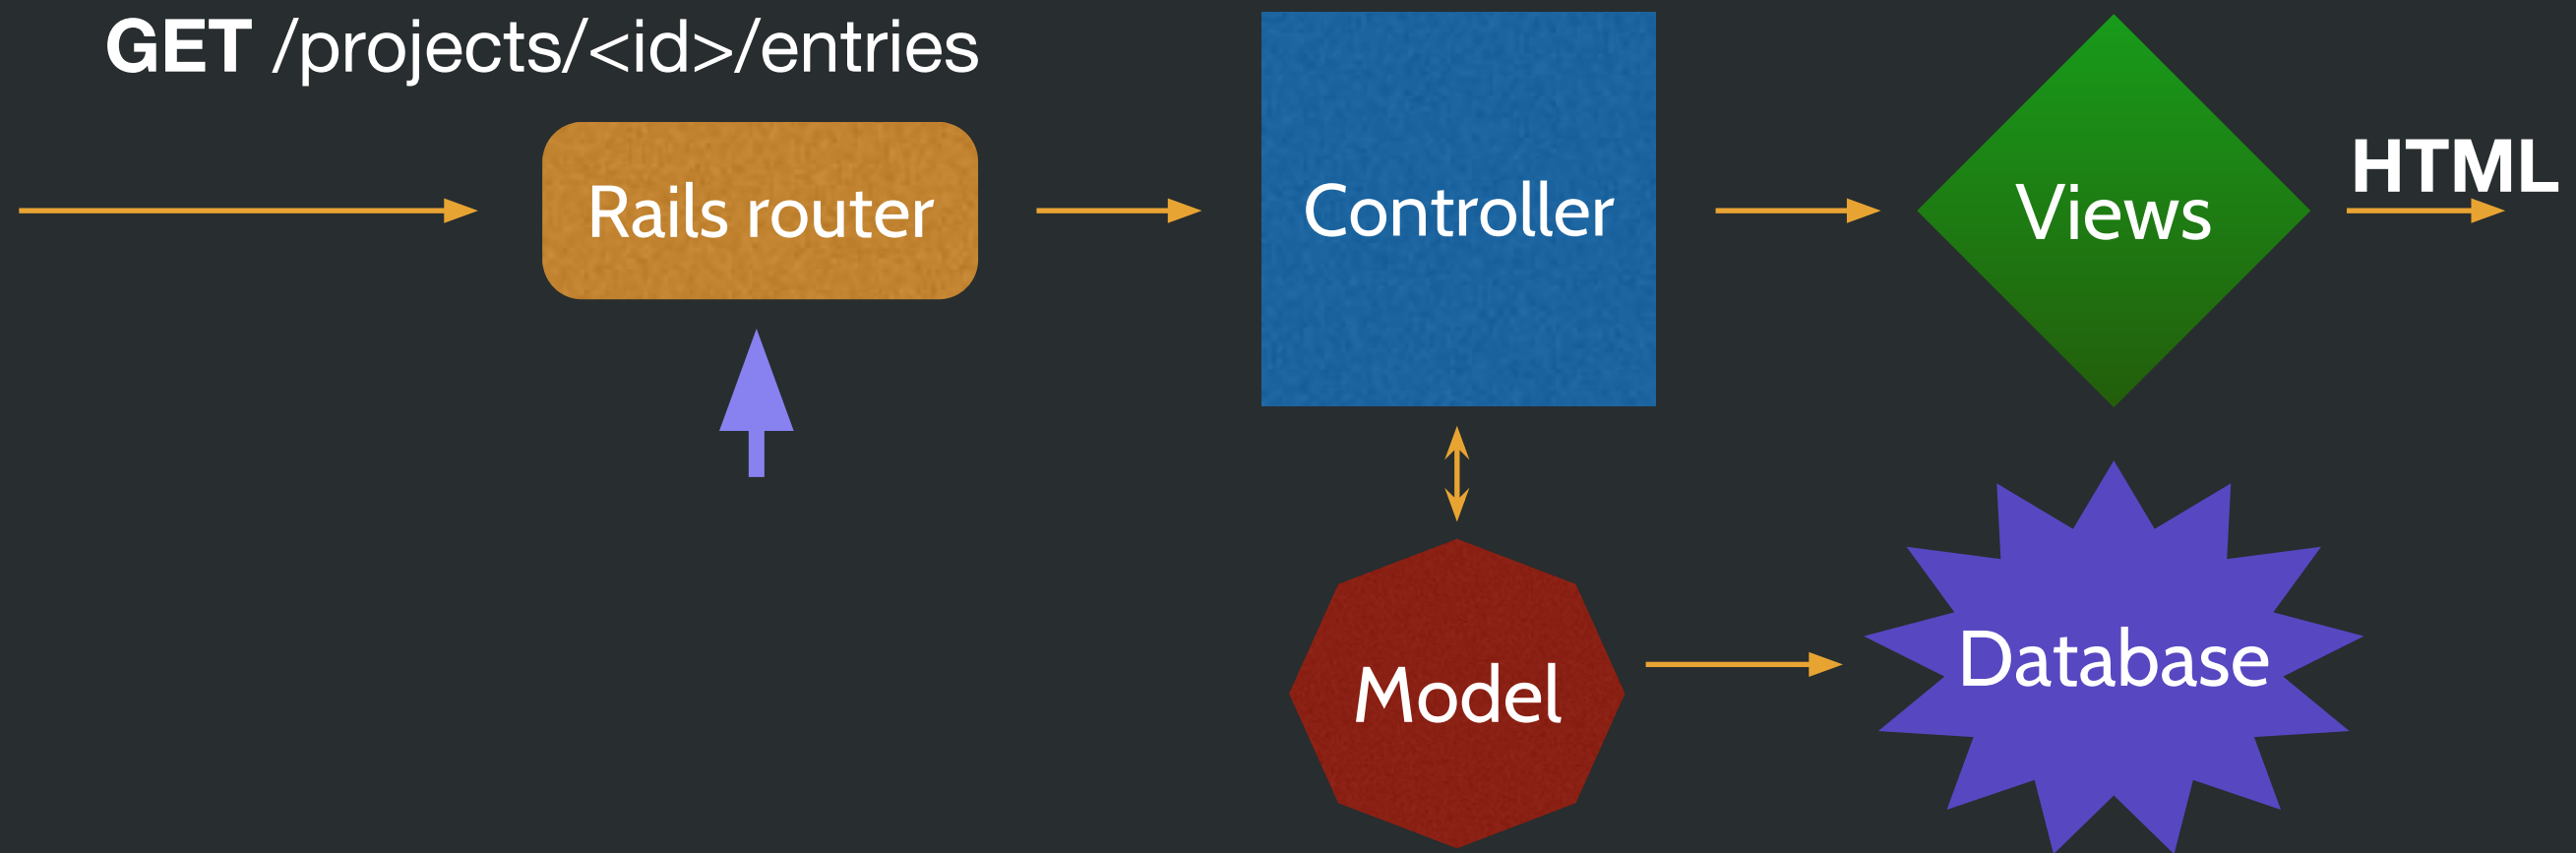

Parameter!

/projects/<id>/time_entries

Project
identifier!

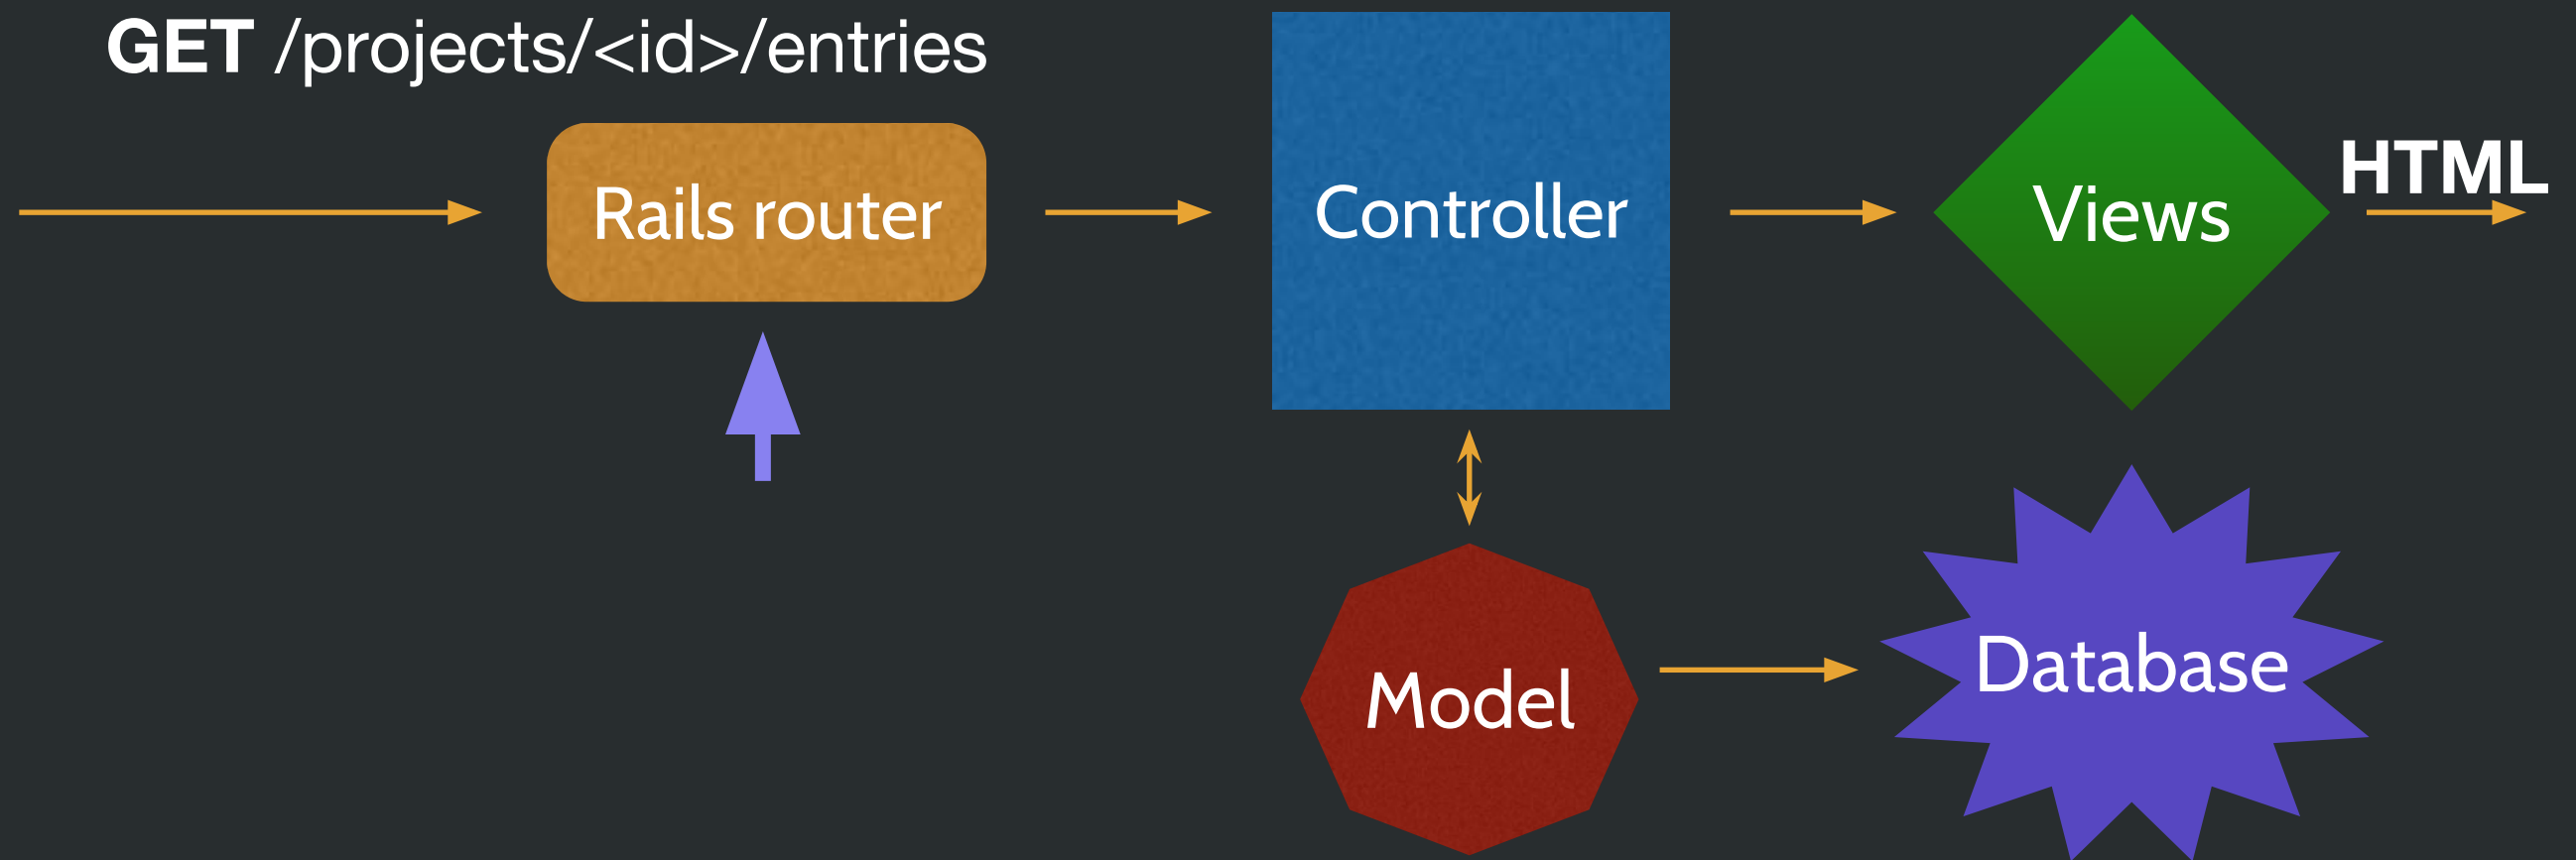

config/routes.rb

```
Timetracking::Application.routes.draw do

  get '/', to: 'site#home'
  get '/projects', to: 'projects#index'
  get '/projects/:id', to: 'projects#show'
  get ??

end
```

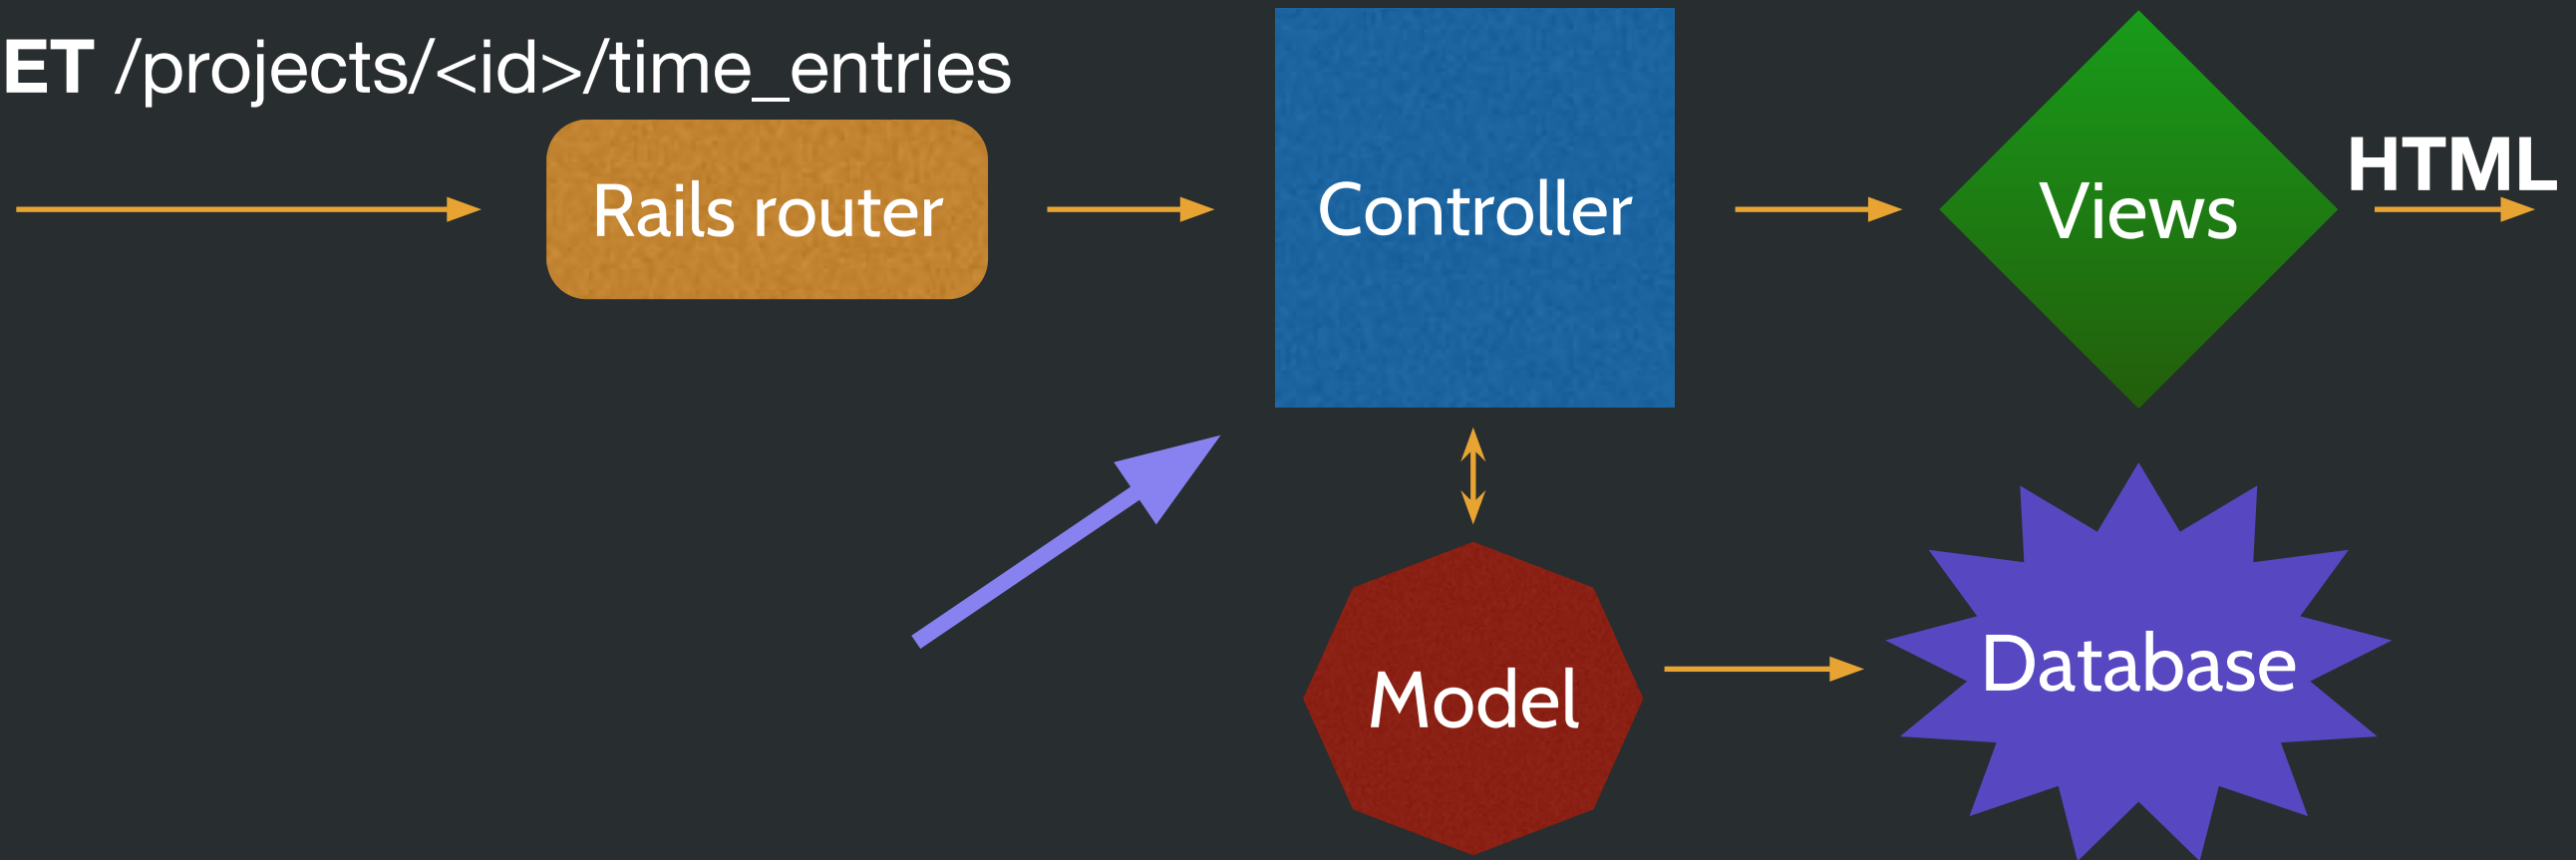

config/routes.rb

```
Timetracking::Application.routes.draw do
  get '/', to: 'site#home'
  get '/projects', to: 'projects#index'
  get '/projects/:id', to: 'projects#show'
  get '/projects/:id/time_entries', to: 'time_entries#index'
end
```

Why a new controller?

- It's a good practice to leave controllers the **CRUD** responsibility of only one resource
- Although the path of request is in the projects resource, it's representing a nested relation

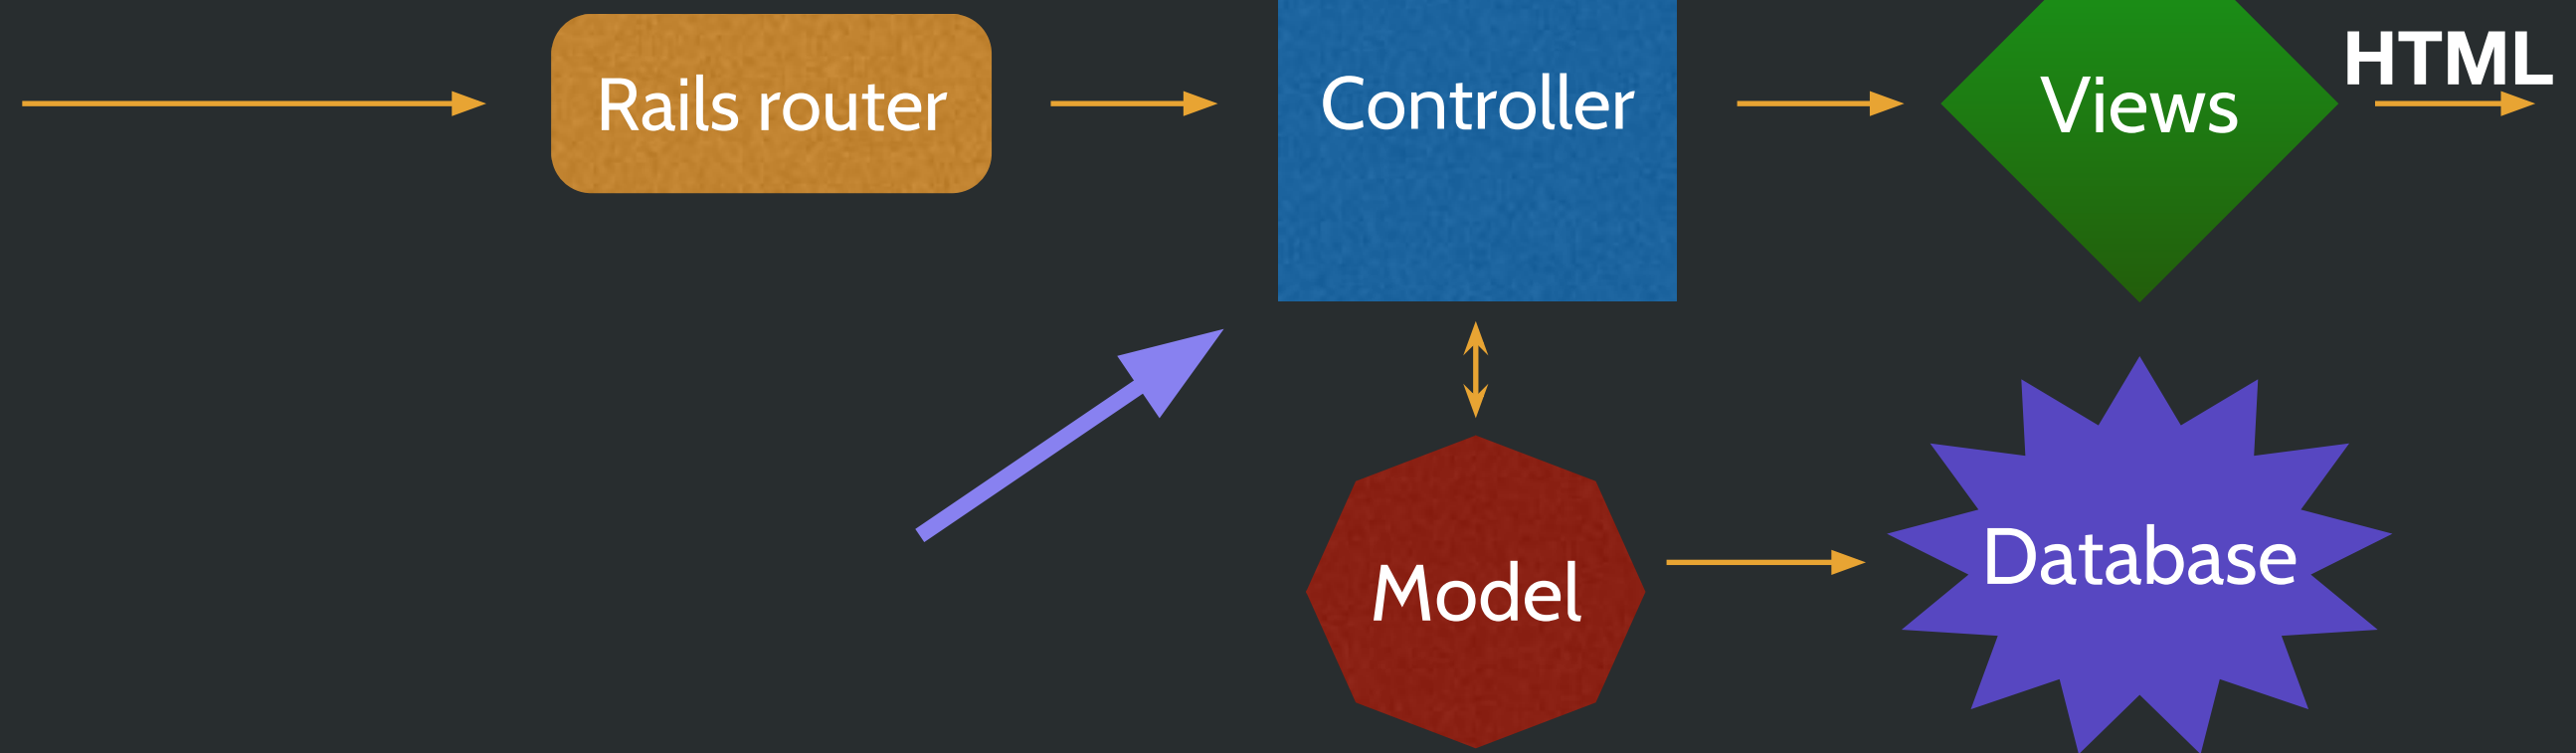

GET /projects/<id>/time_entries

```
$ rails g controller time_entries
```

```
app/controllers/time_entries_controller.  
rb
```

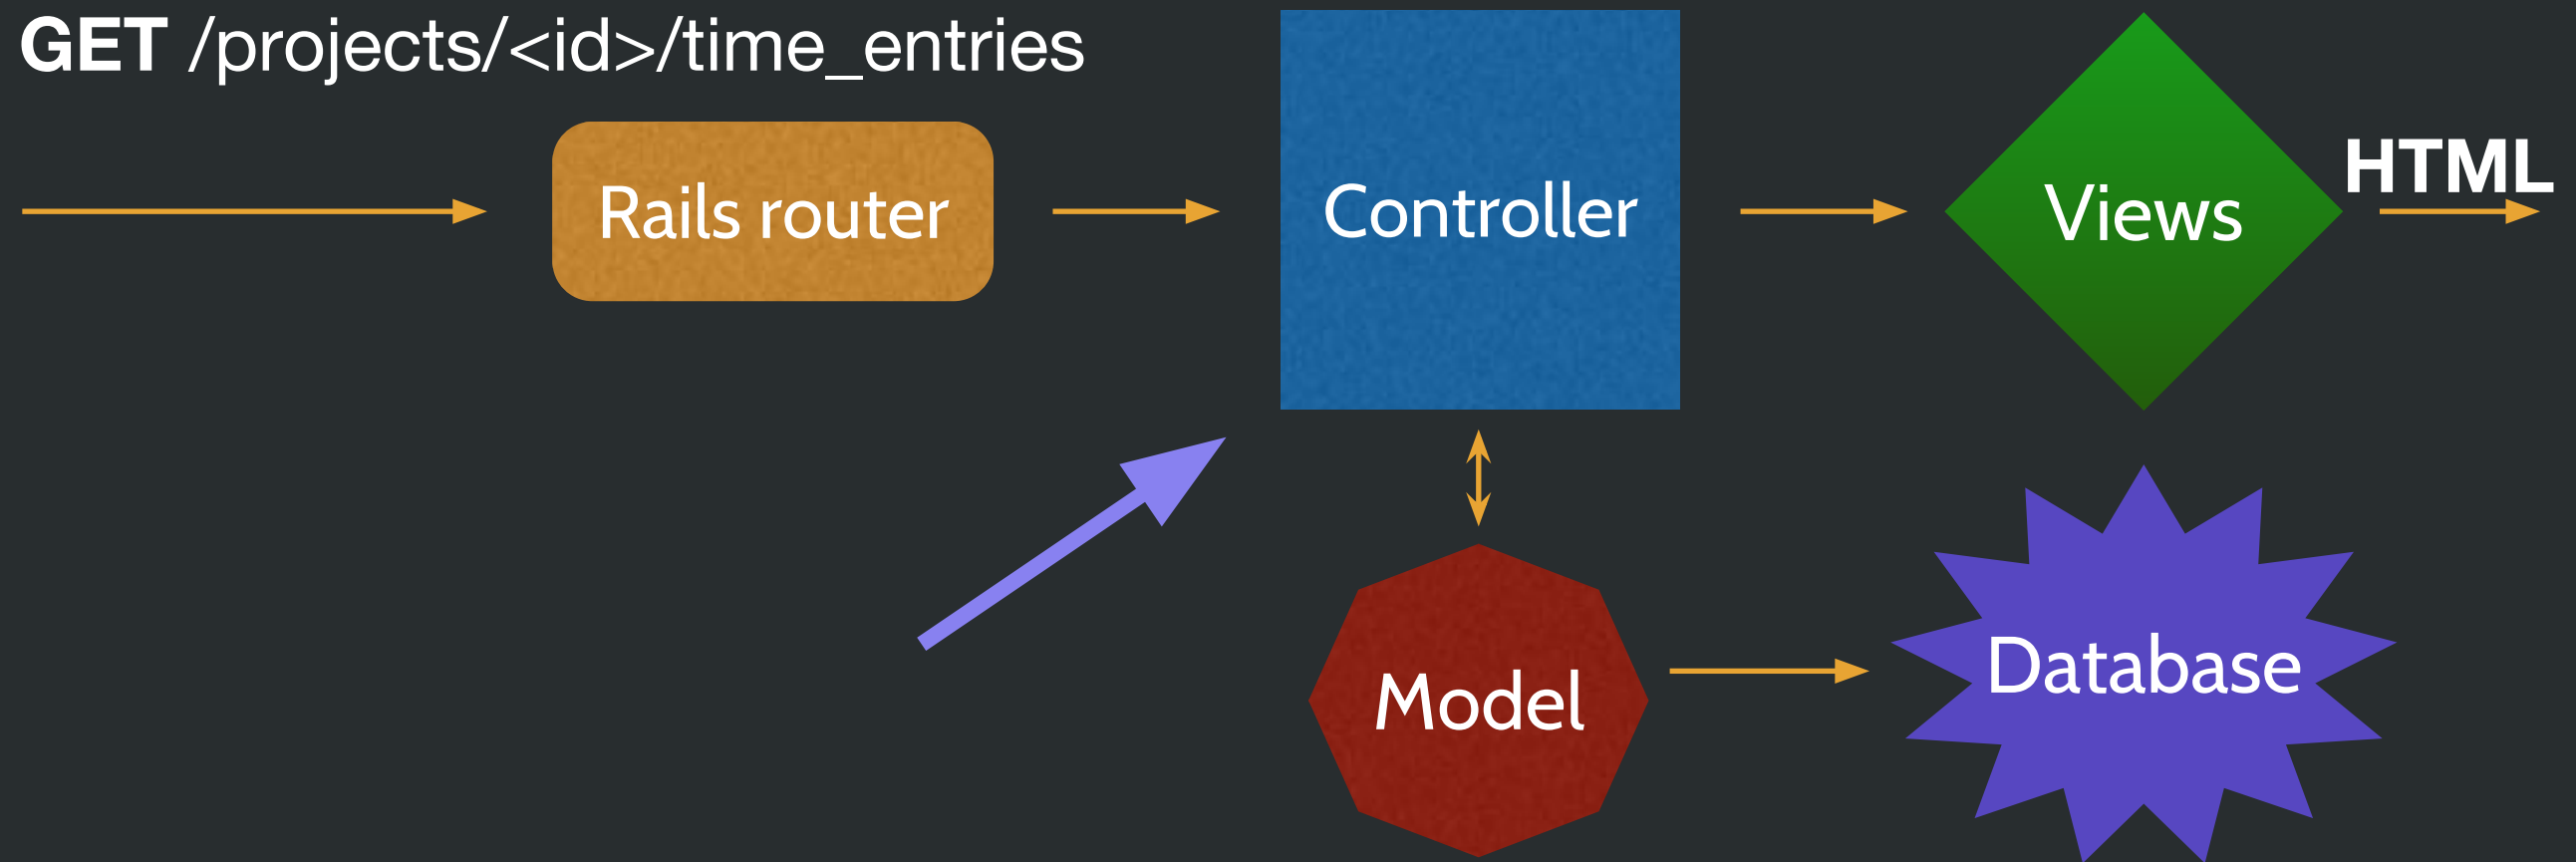

GET /projects/<id>/time_entries

app/controllers/time_entries_controller.rb

```
class TimeEntriesController < ApplicationController
  def index
  end
end
```

GET /projects/<id>/time_entries

app/controllers/time_entries_controller.rb

```
class TimeEntriesController < ApplicationController
  def index
    ??
  end
end
```

/projects/<id>/time_entries

```
class TimeEntriesController < ApplicationController
  def index
    @my_project = Project.find(params[:id])
    @my_entries = @my_project.time_entries
  end
end
```

app/views/entries/index.html.erb

```
<h1><%= @my_project.name %></h1>
<ul>
  <% @my_entries.each do |entry| %>
    <li>
      <%= entry.hours %> h
      <%= entry.minutes %> m -
      <%= entry.date %>
    </li>
  <% end %>
</ul>
```

Exercise

Update the routes and the controllers to rename the parameter of the new URL to `:project_id`

config/routes.rb

```
Rails.application.routes.draw do
  get '/', to: 'site#home'
  get '/projects', to: 'projects#index'
  get '/projects/:id', to: 'projects#show'
  get '/projects/:project_id/time_entries', to: 'time_entries#index'
end
```

app/controllers/time_entries_controller.rb

```
class TimeEntriesController < ApplicationController
  def index
    @my_project = Project.find(params[:project_id])
    @my_entries = @my_project.time_entries
  end
end
```

Exercise

Update the entries page to display only the entries of this month.
